■ HISTORY

- 1973.10. TAI HAN MARCON CO., LTD. (TMC) was established as joint ventured company.
1983. 5. TCC was merged with DAEWOO CORP. and started newly formed company DAEWOO ELECTRONIC COMPONENTS CO., LTD. (DEC)
1985. 7. Aluminum electrolytic capacitor manufacturer approval under IECQ system.
- 1985.11. Line of Tantalum Electrolytic capacitor was set up.
1989. 6. Jungeup plant was established. (Product : HIC, TA CAPACITORS, THERMISTOR, DY, FBT, etc.)
1993. 9. Aluminum electrolytic capacitor qualification approval under ISO-9002 system. (By LR-QA)
- 1994.12. Vietnam Plant was established. (CE, TA)
- 1998.4 Received the best award in Productivity competition from korea Productivity center (KPC)
- 1998.11 Received the best award in industrial Engineering (I.E) competition from Korea Management Association Consulting (KMAC)

SCHEME OF DAEWOO AL ELECTROLYTIC CAPACITORS

Miniature Capacitors

Large Sized Capacitors

GUIDELINES FOR USING ALUMINUM ELECTROLYTIC CAPACITORS

1. DC Electrolytic Capacitors are polarized.

Make sure of the polarity. The polarity is marked on the body of the capacitor. Application of the reversed voltage may cause a short circuit or damage the capacitor. Use bipolar capacitors when the polarity is not determined or unknown. Note that DC electrolytic capacitors cannot be used for AC application.

2. Do not apply a voltage exceeding the rated voltage.

If a voltage exceeding the rated voltage is applied, the leakage current will increase, which may damage the capacitor. Using capacitors at recommended working voltage prolongs capacitor life.

3. Use specially designed capacitors for the circuits where charge and discharge are frequently repeated.

In the circuit subjected to rapid charge and discharge cycles, capacitors may be damaged. Be sure and use special capacitors in these applications.

4. Do not allow excessive ripple current through the capacitor.

The flow of ripple current over the permissible ripple current will cause heat of the capacitor, which may decrease the capacitance and damage the capacitor. Ripple current on the capacitor must be at or below allowable level.

5. Storage

The characteristics of electrolytic capacitors depend on temperature ; the higher the ambient temperature, the faster the deterioration proceeds (leakage current increases, $\tan\delta$ increases and capacitance drops). Humidity is another deteriorating factor. Capacitors may have their lead wires/terminals oxidized, impairing solderability, when stored in humid place for long periods of time.

Aluminum electrolytic capacitors should be stored at room temperature in dry places out of direct sunlight.

- Apply voltage treatment to the capacitor which has been stored for a long time.

If the electrolytic capacitor is allowed to stand for a long time, its working voltage is liable to drop, resulting in increased leakage current. If the rated voltage is applied to such a product, a leakage current occurs and this generates internal heat, which damages the capacitor.

If the electrolytic capacitor is allowed to stand for more than 2 years, apply a voltage treatment(applying the rated voltage for 30 minutes at room temperature)

before use.

- Care should be used in selecting a storage area.

If electrolytic capacitors are exposed to high temperature caused by such things as direct sunlight, the life of the capacitor may be adversely affected.

Storage in a high humidity atmosphere may affect the solderability of lead wires and terminals.

6. Be sure of the temperature range.

The characteristics of capacitors change with the operating temperature.

The capacitance and leakage current increase and $\tan\delta$ decreases at higher temperature. The capacitance and leakage current decrease, and $\tan\delta$ increases at lower temperature. Usage at lower temperature will ensure longer life.

7. Tangent of loss angle increases at higher frequencies.

The tangent of loss angle($\tan\delta$) increases as the applied frequency becomes higher whereas decreases as the ambient temperature becomes higher.

8. Capacitance decreases at higher frequencies.

The capacitance value is measured at 120Hz. The capacitance decreases as the applied frequency becomes higher whereas increases as the ambient temperature becomes high.

9. Do not apply excessive force to the terminals and leads.

The excessive strong force applied to the terminals and lead wires may break them and loosen the connections of the internal elements.

10. Hole positions on the circuit board.

Through-holes on the circuit board as well as lead holes of post-process parts can result in solder splashing onto the vinyl sleeve, causing damage. Consider hole positions carefully.

11. Be cautious of the temperature and duration when soldering

Incorrect soldering may shrink or break the sleeve. Please read the following information carefully, before soldering.

- Too high a soldering temperature or too long a soldering time may cause secondary shrinking of the sleeve which unnecessarily exposes the container. No problems will be observed at a soldering temperature of 260°C or below for no more than 10 seconds.

GUIDELINES FOR USING ALUMINUM ELECTROLYTIC CAPACITORS

- Soldering may melt or break the sleeve, if the sleeve is in contact with circuit patterns.

To avoid this problem, the capacitors should be mounted slightly raised from the circuit board. (Lead formed capacitors are recommended.)

- Sleeve may be melted by solder which has migrated up through the terminal holes on the circuit board. To avoid this problem, the same application as stated in the foregoing paragraph is recommended.

- When soldering, heated lead wires or terminals of adjacent components tear the sleeve if contacted.

Please mount carefully so as not to bring adjacent components' terminals or lead wires into contact with the sleeve, particularly when mounting on through-hole circuit boards.

12. The capacitor case is not insulated from the cathode terminal.

The capacitor's case and cathode terminal connect through the electrolyte. If the case is to be completely insulated, that insulation must be at the capacitor's mounting point.

13. Adhesives and coating materials

When using a latex-based adhesive on the capacitor's rubber mouth seal for adhesion to a printed circuit board, corrosion may occur depending on the kind of solvent in the adhesive.

Select an adhesive as an organic solvent with dissolved polymer that is not halogenated. For polymer, avoid the use of chloroprene.

Also coating and damp-proof materials are including halogenated hydrocarbon, so special care should be taken for use.

14. Cleaning of the circuit board after soldering

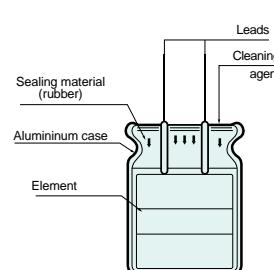

Aluminum can be aggressively attacked by halide ions, particularly by chloride ions.

Even small amounts of chloride ions inside the capacitor will cause corrosion accidents rapid capacitance drop and venting. Therefore, the prevention of chloride contamination is the most important check point for quality control in production lines. At present, the halogen organic solvent such as Freon are commonly used to remove soldering pastes from circuit boards.

When an aluminum electrolytic capacitor is immersed in a halogen organic solvent (e.g;chlorosen, Freon TE, Freon TES, etc.), the halogen organic solvent (cleaning agent) infiltrates into the aluminum electrolytic capacitor where the halogen ions separate and react with the aluminum to cause corrosion. The infiltration mecha-

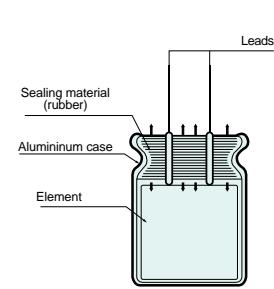

nism of the cleaning agent and the corrosion mechanism are hypothesized below.

- Cleaning agent trapped inside sealing material (rubber packing, terminal board) when capacitor is cleaned.

and the properties of the rubber packing.

- Diffusion of cleaning agent trapped inside rubber packing.

the cleaning agent trapped in the rubber packing infiltrates towards the element.

● Corrosion mechanism

The cleaning agent infiltrating the element undergoes a decomposition reaction which frees chloride. This chloride reacts with aluminum, resulting in corrosion. When the capacitor is powered, the negative chloride ions migrate toward the anode. Therefore, corrosion occurs only at the anode.

Chloride ion can penetrate through imperfections and microcracks in the aluminum oxide dielectric layer to reach the underlying aluminum metal. At these points the metal is attacked with production of a soluble chloride in this anodic half-cell reaction ;

There is always at least 1~2% water in the electrolyte and this is sufficient to hydrolyze the AlCl_3 :

This reaction releases chloride ion for further attack of aluminum. The hydrogen ion increases the local acidity which causes oxide dielectric to dissolve. Thus localized

GUIDELINES FOR USING ALUMINUM ELECTROLYTIC CAPACITORS

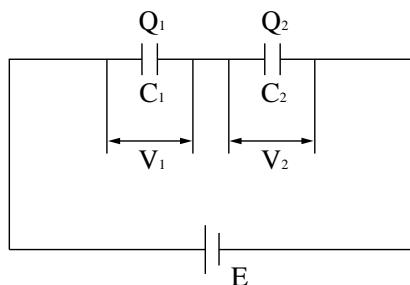

corrosion occurs at an accelerated pace with attack of both metal and dielectric. Therefore, with the exception of capacitors designated as solvent-proof, alcohol based solvents rather than chlorinated hydrocarbons are recommended for cleaning.

Some adhesives, dampproofing agents and dustproofing agents also contain halides and should be used with caution.

Recommended cleaning solvents

General name	Composition
Freon TF (Daiflon S3)	① 1.1.2 – trichloro 1.1.2 – trifluorethane
Freon TE (Daiflon S3-E)	② ; ① + ethanol
Freon TES (Daiflon S3-ES)	③ ; ① + ethanol + stabilizer
Freon TP-35 (Daiflon S3-P35)	④ ; ① + isopropyl alcohol
Freon TMS (-)	⑤ ; ① + methanol + stabilizer

15. For series connection

Where

C_1 : The capacitance of A

C_2 : The capacitance of B

V_1 : The voltage between terminals of A

V_2 : The voltage between terminals of B

E : The voltage of power supply

Q : The magnitude of the stored charge ($Q=Q_1=Q_2$)

● Analysis

$$Q_1 = Q = C_1 V_1, \quad Q_2 = Q = C_2 V_2 \quad \text{eq 1}$$

From eq1)

$$V_1 = \frac{Q}{C_1} \quad V_2 = \frac{Q}{C_2} \quad \text{eq 2}$$

$$E = V_1 + V_2 = \frac{Q}{C_1} + \frac{Q}{C_2} = \frac{C_1 + C_2}{C_1 \cdot C_2} \cdot Q$$

$$Q = \frac{C_1 \cdot C_2}{C_1 + C_2} \cdot E = C \cdot E$$

From eq 2)

$$C_1 V_1 = \frac{C_1 C_2}{C_1 + C_2} \cdot E \quad C_2 V_2 = \frac{C_1 C_2}{C_1 + C_2} \cdot E \quad \text{eq 3}$$

From eq 3)

$$V_1 = \frac{C_2}{C_1 + C_2} \cdot E \quad V_2 = \frac{C_1}{C_1 + C_2} \cdot E$$

When capacitors are used in series connection, the voltage is divided reversal proportional to the ratio of the capacitance, when capacitors are being charged.

Thus, the voltage applied to the capacitor depends on the capacitance.

Unbalanced capacitance could cause the excessive voltage application and safety vent operation.

The applying voltage unbalancing can be reduced by choosing a couple of capacitors that have the capacitance within 5% differences.

16. Blank terminals must be mounted to an electrically isolated place.

Blank terminals are not perfectly isolated from the element. It is important when planning the printed circuit board to electrically isolate the blank terminals.

The blank terminals are for added stability only, and should never be electrically connected to either the positive or negative terminal.

17. Mounting

The distance between the terminal holes on the circuit board should be the same as that between the lead wires or terminal of the capacitor.

Excessive force in mounting on circuit boards should be avoided.

Radial lead type

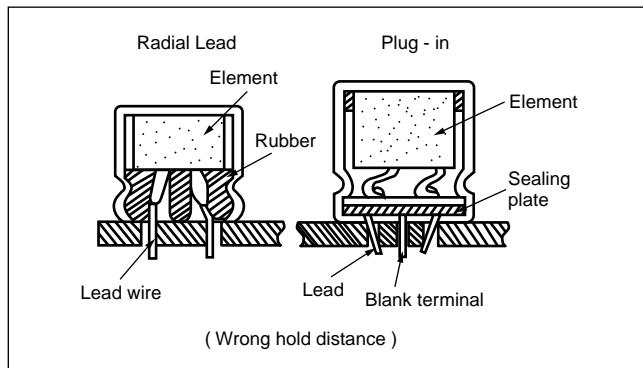

Improper insertion of the lead wires in circuit boards may cause electrolyte leakage or break the lead wires or impair their connection with the internal elements.

When the distance between the two terminal holes on the circuit board cannot be reduced to that between the lead wires, lead formed capacitors are recommended.

GUIDELINES FOR USING ALUMINUM ELECTROLYTIC CAPACITORS

Snap-in type

Improper insertion of the terminals in circuit boards may break the terminals or impair their connection with the internal elements.

18. Method for testing

The method shall comply with KS C6035, KS C6421(JIS C5102, JIS C5141). Except lead solderability. The lead solderability meets the requirements of MIL-STD 202, Method 208.

19. When Ordering

When you order aluminum electrolytic capacitors, selecting parts listed in this catalog will result in favorable prices and delivery schedules.

When ordering items not listed in this catalog, confirm the following points before notification

- (1) Type and/or series name, application.
- (2) Rated voltage and nominal capacitance
- (3) Usage temperature range and ripple current
- (4) Sizes and dimensions
- (5) Other special requirement

20. Part number system

(1) Ordering code system

[A] / [B] - [C] / [D] - [E] × [F] × [G]

ex) RSS/TAA-100/10-5 × 11 × 5

[A] : Series code - See Quick guide of page 1

[B] : Lead taping & lead forming/cut code - See page 7~9

[C] : Capacitance(μF)

[D] : Rated voltage (W.V.)

[E] : Case dia (φD)

[F] : Case height (L)

[G] : Lead space (f)

Reflow soldering

- (1) For reflow, use a thermal conduction system such as infrared radiation or hot plate
- (2) Observe proper soldering conditions (temperature, time etc.,). Do not exceed the specified limits.
- (3) Reflow should be performed one time.

- Pre-heat Condition
- Temperature : 150°C. max.
- Time : 120sec. max.

MINI GLOSSARY

• Summary of electrolytic capacitors

● Principle

The ability of a capacitor to store electrical energy is a direct function of its mechanical geometry and its chemical composition. The amount of energy that it can store is given by equation :

$$Q = CV$$

where Q = the magnitude of the stored charge

C = the capacitance in farads

V = the applied voltage

The value of capacitance is directly proportional to the(anode) surface area and inversely proportional to the thickness of the dielectric layer, thus :

$$C = \epsilon_r \cdot \epsilon_0 \cdot \frac{A}{d}$$

where ϵ_0 = absolute permittivity($8.85 \times 10^{-12} \text{ F/m}$)

ϵ_r = relative dielectric constant(dimensionless)

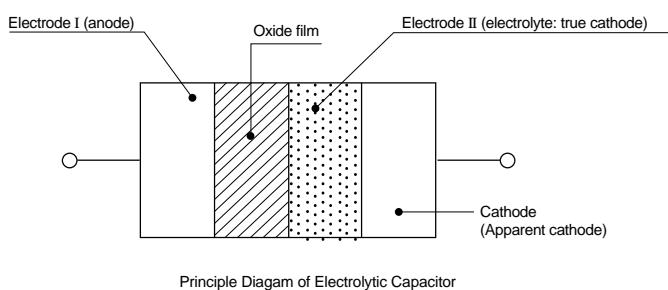

A = surface area (m^2)

d = thickness of dielectric (oxide layer in electrolytic capacitors)in m

The energy content of a capacitor is given by :

$$P = \frac{1}{2} C \cdot V^2$$

Electrolytic capacitors are distinguished from other capacitors by the uniqueness of their electrode materials and dielectric. This is explained in the principle diagram of the electrolytic capacitor in below.

General capacitors can, in theory, use any kind of material for electrodes I and II as long as it is a conductor, and the same is true for the dielectric as long as it is a good insulator. In addition, electrode I and II can serve as the anode and cathode or vice versa without any problem.

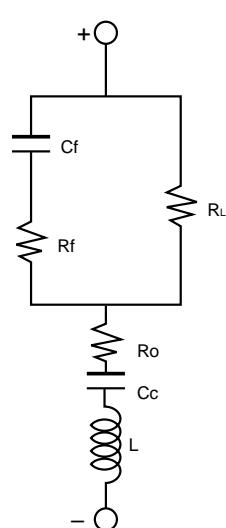

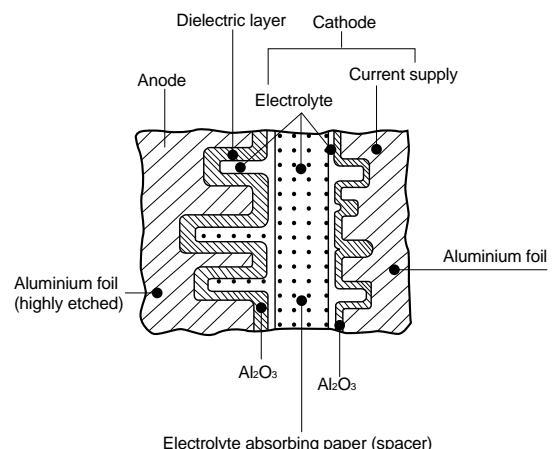

However, this is not true with electrolytic capacitors, in which electrode I is limited to aluminum(Al), tantalum(Ta), niobium(Nb), titanium(Ti), zirconium(Zr), hafnium(Hf) and other metals (referred to as valve metals) which form a fine, highly insulative oxide film on its surface during anodic oxidation in an electrolyte solution. Currently, the only two metals in practical application are aluminum and tantalum.

The oxide film that forms on the surface of electrode I due to anodic oxidation serves as a dielectric.

The oxide film becomes an electrical insulator and functions as a dielectric only when the electrode on which it forms is the anode. Therefore, electrolytic capacitors are, in principle, capacitors with polarity.

Electrode II serves as a cathode that yields capacitance with a liquid or solid electrolyte.

● Equivalent circuit of Aluminum electrolytic capacitor

C_f : capacitance of anode oxide film

C_c : capacitance of cathode

R_f : equivalent series resistance of anode oxide film

R_o : composite resistance of electrolyte and electrolytic paper

R_L : resistance of leakage current

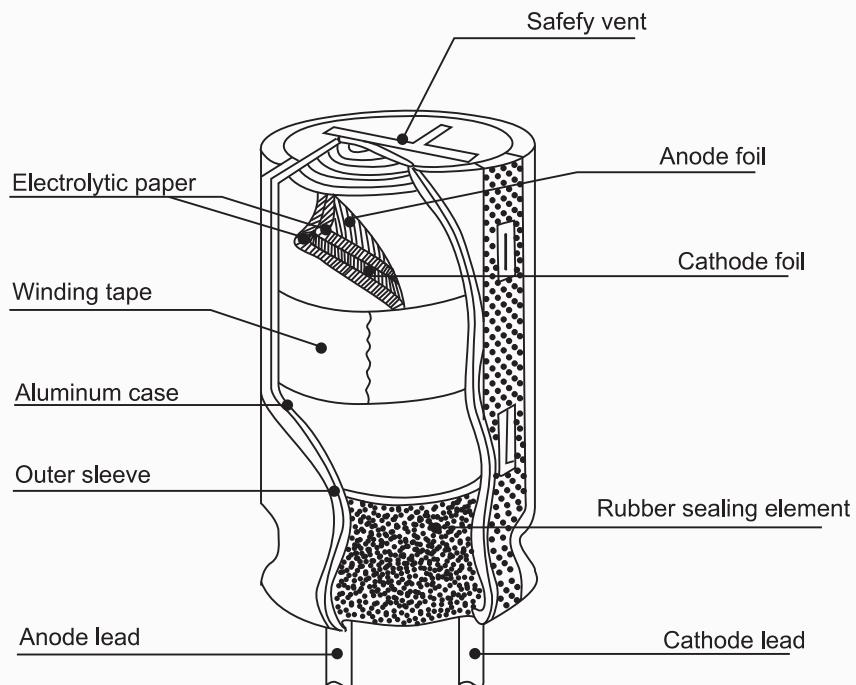

L : inductance of electrode length, leads, etc.

R : equivalent series resistance (R_f+R_o combined resistance)

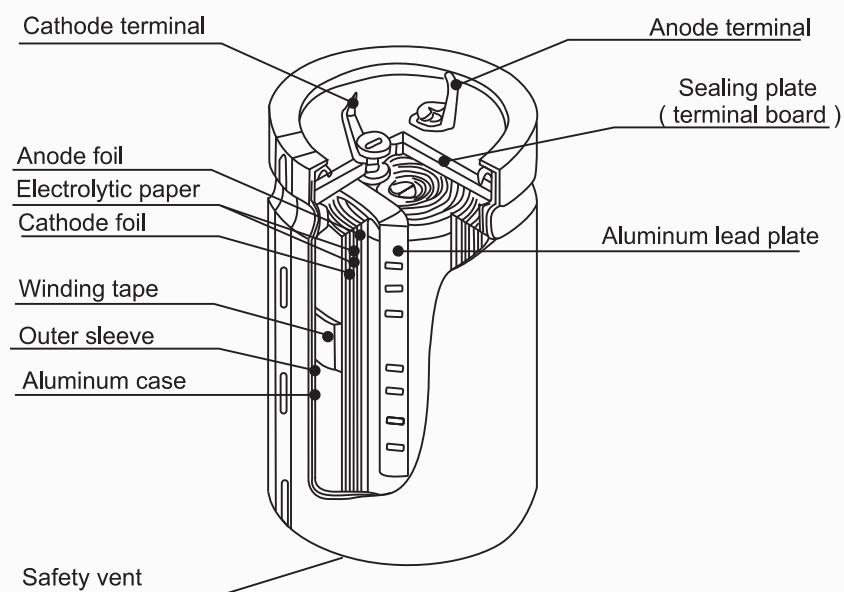

MINI GLOSSARY

● Construction

- Radial lead type

- Snap-in type

MINI GLOSSARY

II Definition of the electrical parameters

1. Nominal Capacitance

The nominal capacitance of the capacitor is the value which is indicated upon it.

2. Leakage Current

The leakage current is the conduction current flowing through a capacitor, when a DC voltage equal to the rated voltage is applied to the capacitor.

3. Tangent of Loss Angle($\tan \delta$)/Dissipation Factor

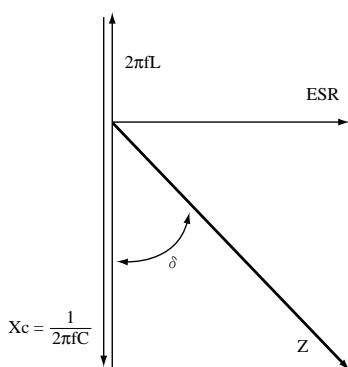

The power loss of the capacitors divided by the reactive power of the capacitor at a sinusoidal voltage of specified frequency.

$$\tan \delta = \frac{\text{ESR}}{X_c}$$

Where ESR : Equivalent series resistance(Ω) of capacitor

X_c : Reactance(Ω) of capacitor

$$\text{D.F.} = \text{ESR}/X_c \times 100(\%)$$

Vector diagram showing the AC parameters of a capacitor.

Note : Equivalent series resistance (E.S.R) may also be used as a means to define a single resistance representing all the ohmic losses in the capacitor.

$$\text{ESR}(\Omega) = \frac{\tan \delta}{2\pi f C} = \frac{\text{D.F.}}{2\pi f C \times 100}$$

where f = measured frequency in Hz

C = measured capacitance in farads

4. Operating Temperature Range

The operating temperature range is the range of ambient temperature for which the capacitor has been designed to operate continuously.

5. Rated Voltage / Working Voltage

The rated DC voltage is the maximum operating voltage which is the sum of the DC voltage and peak AC voltage applied to the capacitors and which may be applied continuously to the capacitors at temperature within the operating temperature range.

6. Capacitance Tolerance

The tolerance for capacitance stated in percent of the nominal capacitance.

7. Surge Voltage

The surge voltage is the maximum DC voltage to which the capacitor may be subjected at normal room temperature for 30 seconds at infrequent intervals of not less than 5 minutes. The rated surge voltages are as follows :

Rated Voltage (V)	4	6.3	10	16	25	35	40
Surge Voltage (V)	5	8	13	20	32	44	50

Rated Voltage (V)	50	63	80	100	160	180	200
Surge Voltage (V)	63	79	100	125	200	225	250

Rated Voltage (V)	250	315	350	400	450
Surge Voltage (V)	300	365	400	450	500

8. Ripple Current

Any pulsating voltage(or ripple voltage superimposed on DC bias) across a capacitor results in an alternating current through the capacitor.

Because of ohmic and dielectric losses in the capacitor, this alternating current produces an increase of temperature in the capacitor cell.

The heat generation depends on frequency and wave form of the alternating current.

The maximum RMS value of this alternating current, which is permitted to pass through the capacitor during its entire specified useful life(at defined frequency and defined ambient temperattrue), is called rated ripple current (I_R).

Usually the rated ripple current will cause a temperature increase of the capacitor's surface compared with ambient temperature.

MINI GLOSSARY

This temperature rise is the result of the balance between heat generated by dielectric losses :

$$P = I_R^2 \cdot ESR \quad \text{equation 1)}$$

and the carried off heat by radiation, convection and conduction :

$$P = \Delta T \cdot A \cdot \beta \quad \text{equation 2)}$$

from equation 1) and 2)

$$I_R = \sqrt{\frac{\beta \cdot A \cdot \Delta T}{ESR}} = \sqrt{\frac{2\pi f C \cdot \beta \cdot A \cdot \Delta T}{\tan \delta}}$$

$$\Delta T = I_R^2 \cdot ESR / \beta \cdot A$$

Where

ΔT = Difference of temperature between ambient and case surface

β = Heat transfer constant

A = Geometric surface area of the capacitor

I_R = Ripple current

ESR = Equivalent series resistance

The heat, generated by ripple current, is an important factor of influence for non-solid electrolytic capacitors for calculating the useful life under certain circumstances.

The flow of ripple current over the permissible ripple current will cause heat of the capacitor, which may decrease the capacitance and damage the capacitor.

Ripple current on the capacitor must be at or below allowable level. (The sum of DC voltage and peak voltage shall not exceed the rated DC voltage)

● Ripple current coefficient

When the capacitor is operated in other condition of temperature and frequency which are specified in relevant specification, ripple current multiplied by the factor(coefficient) which is specified in relevant specification can be applied as maximum permissible ripple current.

● Calculation of the applicable RMS ripple current

Non-sinusoidal ripple current (if not accessible by direct measurement) have to be analyzed into a number of sinusoidal ripple currents by means of Fourier-analysis; the sum of the currents thus found may not exceed the applicable ripple current.

For some frequently occurring waveforms, approximation formulae are stated in next for calculating the corresponding RMS value.

WAVE FORM	RMS VALUE
	$A \sqrt{\frac{t_0}{T}}$
	$A \sqrt{\frac{3t_1+2t_2}{3T}}$
	$A \sqrt{\frac{2t_1+3t_2}{3T}}$
	$A \sqrt{\frac{t_0}{2T}}$

Approximation formulae for RMS values of non-sinusoidal ripple currents.

9. Impedance

The impedance(Z) of an electrolytic capacitor is given by capacitance, ESR and ESL according to the following equation :

$$Z_c = \sqrt{ESR^2 + (XL - XC)^2}$$

where

$$XC = \frac{1}{2\pi f C}$$

$$XL = 2\pi f L$$

f = Frequency, C = Farads, L = Henries

where the ESR, capacitance and inductance are the values specified in the manufacturer's literature.

From above equations, the resonant frequency is

$$\text{Freq.} = \frac{1}{2\pi\sqrt{LC}}$$

At resonant frequency, the impedance is equal to the ESR.

MINI GLOSSARY

10. Life and failure rate

- Impress the rated voltage (or superpose prescribed ripple current) for a prescribed time period at the maximum operating temperature.

The test duration, conditions and acceptable drift of electrical parameters after the life test are stated in the relevant detail specification (individual specification).

- Influence of temperature and ripple current on life

The influence of temperature on life is indicated by the so-called doubling 10°C-rule. The doubling 10°C-rule means that each time the temperature increases 10°C, the life of the capacitor decreases by half. This relation is described in next equation.

$$L = L_0 \times 2^{\frac{T_0 - T}{10}}$$

where T_0 : maximum use temperature (°C)

L_0 : guaranteed life time (h)

T : ambient temperature(°C)

L : estimated life (h) at T (°C)

When capacitor is used with ripple current, temperature rises due to this ripple current effects the life of the capacitor, the allowable ripple current at which aluminum electrolytic capacitors can stand up for the guaranteed maximum temperature rise can be treated in the same way as that due to ambient temperature, and an equation which adds the temperature rise due to ripple current to the ambient temperature is sufficient.

$$L = L_0 \times 2^{\frac{T_0 - (T + \Delta T)}{10}}$$

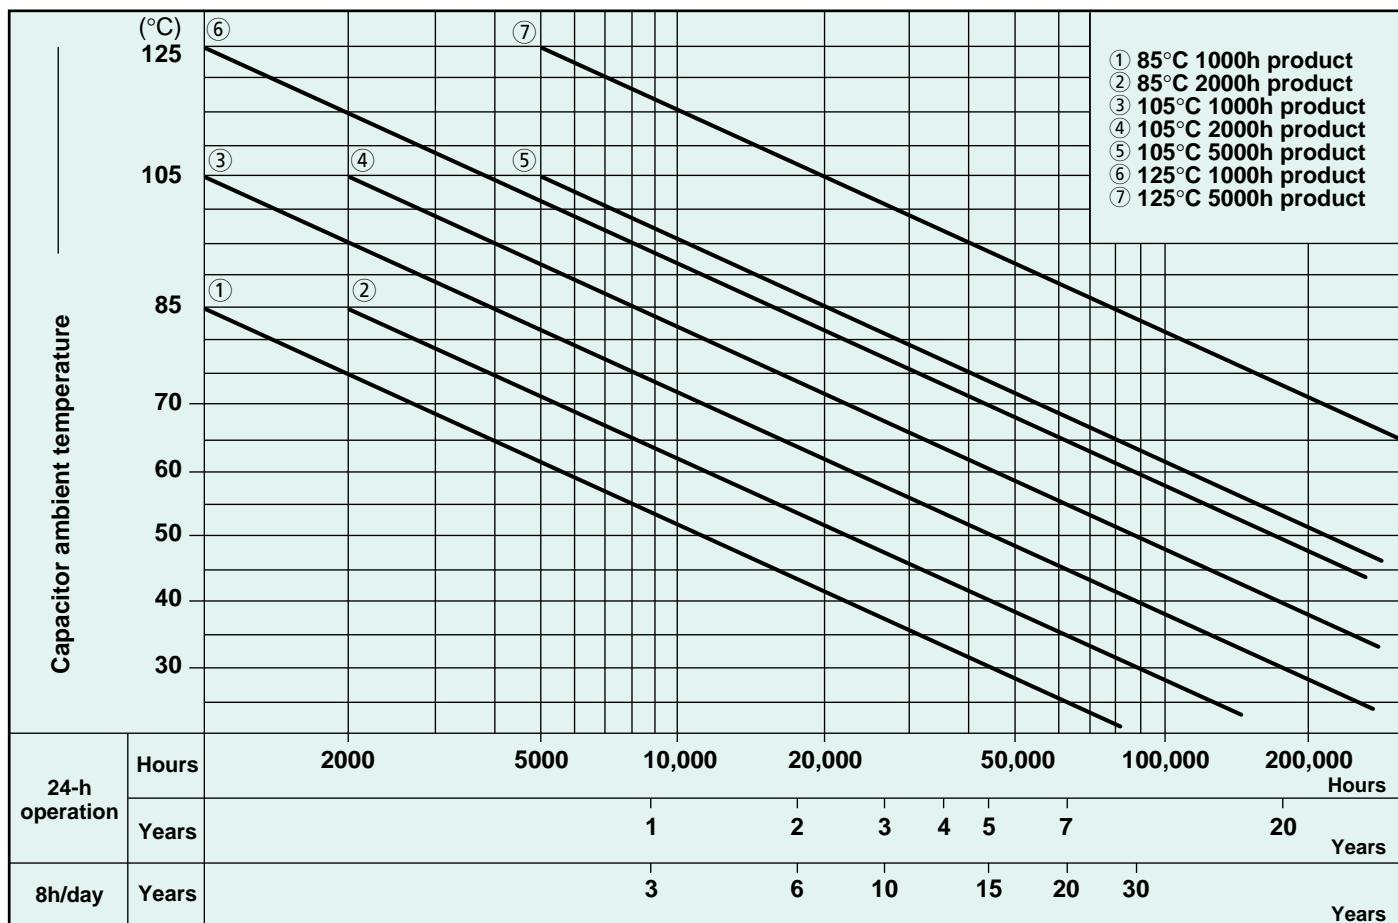

where

ΔT = Temperature rise by ripple current

When used with ripple currents exceeding the allowable ripple current, the “doubling 10°C-rule” dose not hold valid for life acceleration and the life of the capacitor may be markedly shortened and the failure mode changed.

ALUMINUM ELECTROLYTIC CAPACITORS

Life Estimate Chart

MINI GLOSSARY

Failure rate (λ)

The failure rate is defined by the number of components failing within a unit of time, related to the total quantity of components observed :

$$\lambda = \frac{\text{number of failures (statistical upper limit 60\%)}}{\text{total number of components} \times \text{duration}}$$

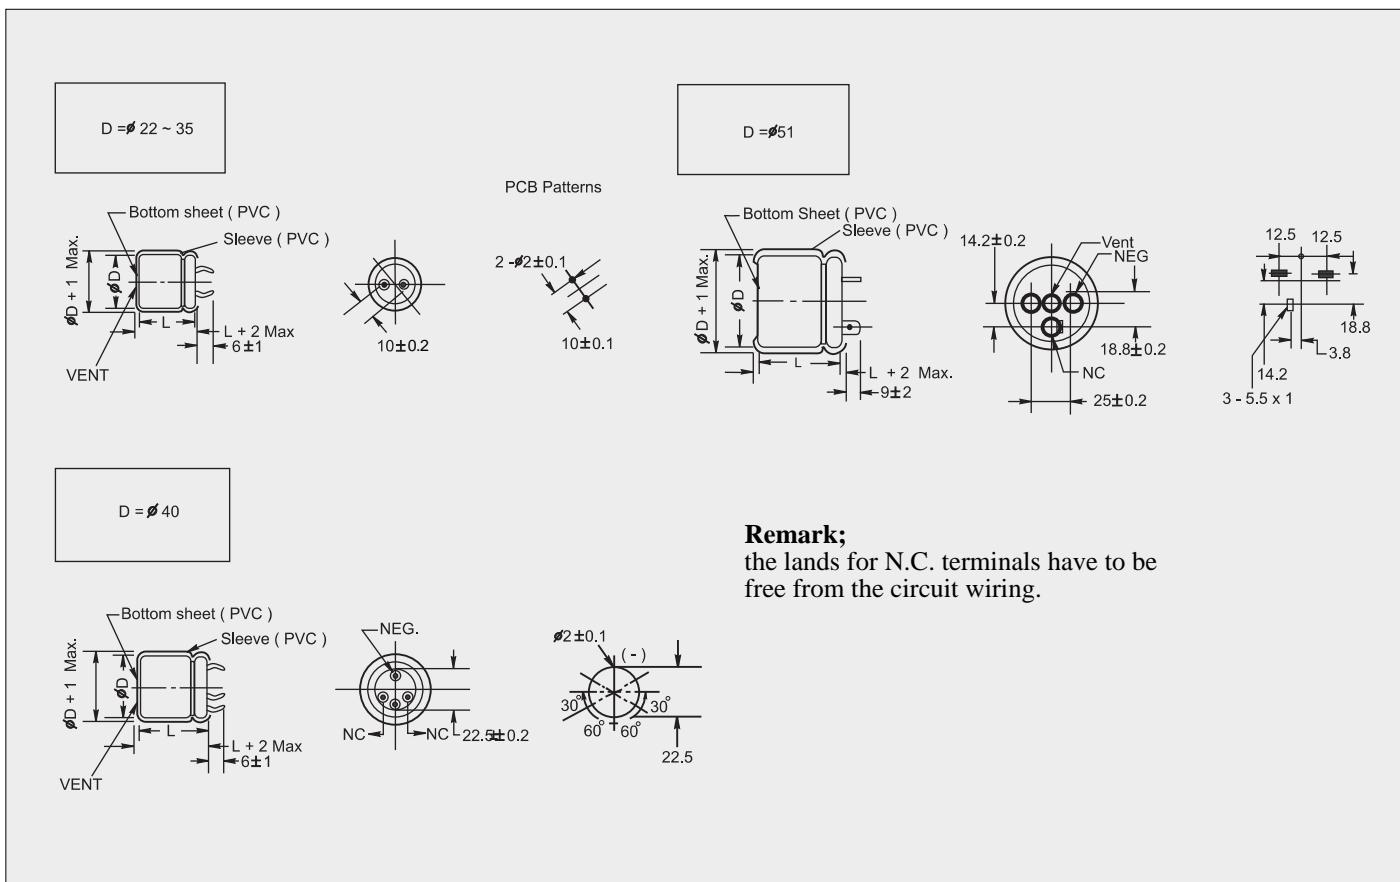

The failure rate(λ) is generally expressed in so-called "fit"(failure in time) = 10^{-9} /hours with an upper confidence level(UCL) of 60%. It is calculated from results of periodical tests in the quality laboratories or derived from field observations respectively.

Usually the failure rate during time shows the well known "bathtub" curve (see next)

There are 3 periods in a typical capacitor life cycle :

a) Initial failure period, showing a rapidly decreasing failure rate. During production of DAEWOO electrolytic capacitors, initial failures are removed after re-forming(which is short aging) : all capacitors shipped, have passed aging.

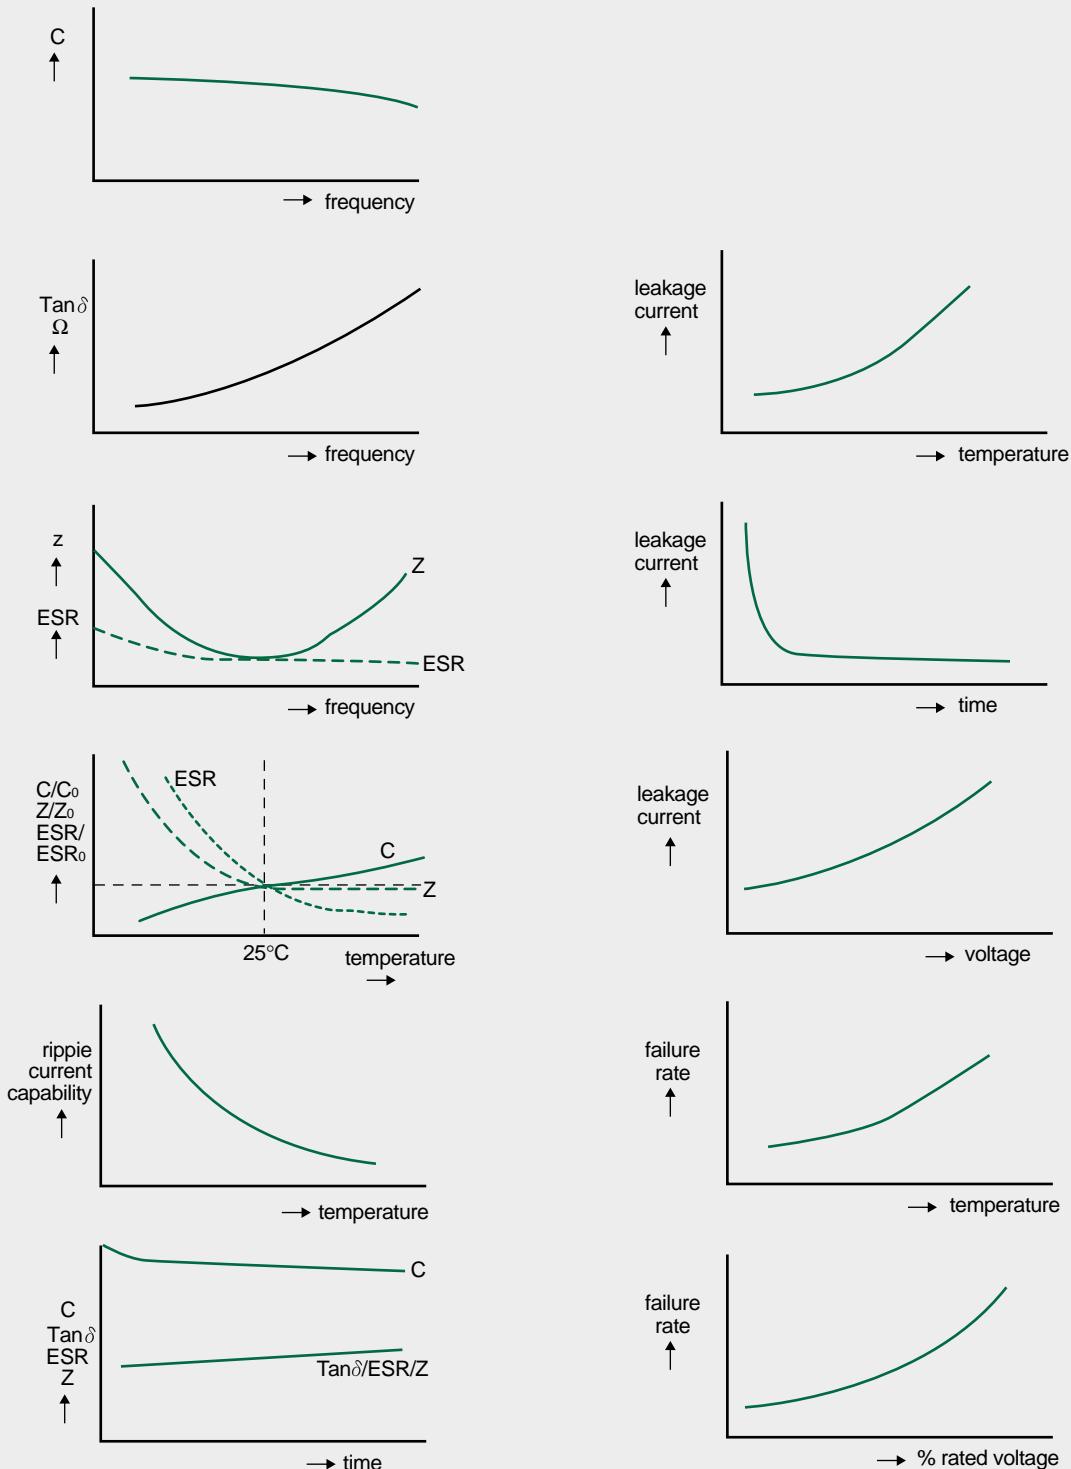

● Standard PCB patterns of PCB mounting type

MINI GLOSSARY

ELECTRICAL CHARACTERISTICS

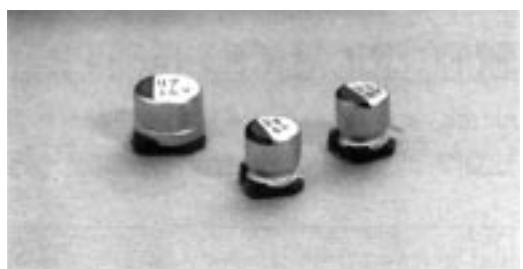

Characteristics of electrolytic capacitors vary temperature, frequency, time and applied voltage.

Typical variation of electrical paramenters as a function of frequency, ambiect temperature, voltage and time.

ALUMINUM ELECTROLYTIC CAPACITORS 105°C Standard, Radial Leads

■ Features

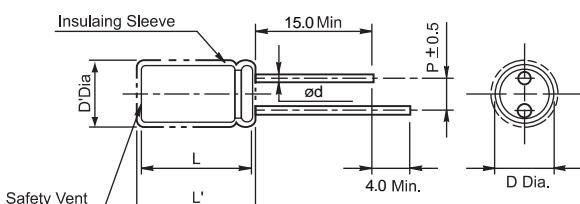

- 105°C Standard, Radial
- Wide operating temperature range
- High and stable quality
- Very high CV capacity per unit volume
- Load life of 1000 hours at 105°C
- Possible cleaning by Freon TE (to 100V : 3 min)

■ Specifications

Item		Performance Characteristics														
Operating temperature range		-40°C ~ +105°C			-40°C ~ +105°C			-25°C ~ +105°C								
Rated working voltage range		6.3V ~ 100V			160V ~ 250V			350 V ~ 450V								
Nominal capacitance range		0.1μF ~ 15000 μF, ±20%(at 20°C, 120Hz)														
D.C Leakage current(at 20°C)		The following specifications shall be satisfied when the rated voltage is applied for the required time. I ≤ 0.01CV + 3μF (2min) I ≤ 0.01CV + 20μA (5min) I ≤ 0.02CV + 30μA (5min) Where I = Leakage current(μA) C= Nominal capacitance (μF) V= Rated voltage (V)														
Tan δ(max., at 20°C, 120Hz)		W.V(V)	6.3	10	16	25	35	50	63	100	160~250	350~450				
		Tanδ	0.24	0.20	0.17	0.15	0.12	0.10	0.10	0.08	0.12	0.20				
		When capacitance is over 1000μF, Tan δ shall be added 0.02 to the listed value with increase of every each 1000 μF.														
Characteristics at low temperature(max.) (impedance ratio at 120Hz)		W.V(V)	6.3	10	16	25	35	50~100	160~250	350~450						
		Z-25°C/Z20°C	4	3	2	2	2	2	2	2	6					
		Z-40°C/Z20°C	8	6	4	3	3	3	3	3	-					
Load life		After applying rated working voltage for 1000 hours at +105°C and then being stabilized at +20°C, capacitors shall meet following limits. Capacitance change Within ± 25% of initial measured value(6.3V~16V) Within ± 20% of initial measured value (25V~) Tanδ ≤ 150% of initial specified value Leakage current ≤ Initial sepcified value														
Shelf life		After storage for 1000 hours at +105°C with no voltage applied and then being stabilized at + 20°C, capacitors shall meet following limits. Capacitance change Within ± 20% of initial measured value Tanδ ≤ 200% of initial specified value Leakage current ≤ 200% of initial sepcified value

RSA SERIES

ALUMINUM ELECTROLYTIC CAPACITORS

Miniature, 7mm Height, High CV, Radial Leads

Features

- Miniature, High CV, Radial
- Lengths are all 7mm(Smaller than RSM)
- VTR, video camera, car radio, micro cassette tape recorder etc.
- Low cost alternative to tantalum beads
- Load life of 1000 hours at 85°C

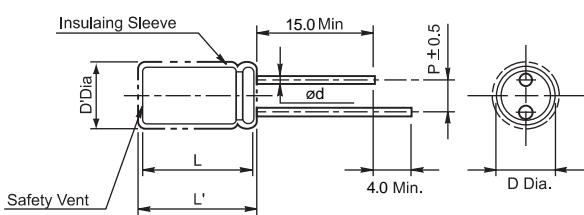

Specifications

Item	Performance Characteristics							
Operating temperature range	-40°C ~ +85°C							
Rated working voltage range	6.3V ~ 50V							
Nominal capacitance range	0.1μF ~ 220μF, ±20%(at 20°C, 120Hz)							
D.C Leakage current(at 20°C)	The following specifications shall be satisfied when the rated voltage is applied for the required time. I ≤ 0.01CV or 3μA(2 min), whichever is greater Where I =Leakage current(μA) C=Nominal capacitance(μF) V=Rated voltage(V)	W.V(V)	6.3	10	16	25	35	50
Tan δ(max., at 20°C, 120Hz)	W.V(V)	6.3	0.26	0.22	0.19	0.16	0.12	0.10

■ Features

- Low leakage current, Radial
- Excellent shelf performance
- Close tolerance and low cost
- Load life of 2000hours at 85°C

■ Specifications

Item	Performance Characteristics							
Operating temperature range	-40°C ~ +85°C							
Rated working voltage range	6.3V ~ 100V							
Nominal capacitance range	0.1μF ~ 2200μF, ±20% or ±10% (at 20°C, 120Hz)							
D.C Leakage current(at 20°C)	<p>The following specifications shall be satisfied when the rated voltage is applied for the required time.</p> <p>$I \leq 0.002CV$ or $0.4\mu A(2\text{ min})$, whichever is greater</p> <p>Where I = Leakage current(μA) C = Nominal capacitance(μF) V = Rated voltage(V)</p>							
Tan δ(max., at 20°C., 120Hz)	W.V(V)	6.3	10	16	25	35	50~80	100
	Tan δ	0.22	0.19	0.16	0.14	0.12	0.10	0.08
When capacitance is over 1000μF, Tan δ shall be added 0.02 to the listed value with increase of every each 1000μF.								
Characteristics at low temperature(max.) (impedance ratio at 120Hz)	W.V(V)	6.3	10	16	25	35	50~100	
	Z-25°C/Z20°C	4	3	2	2	2	2	
	Z-40°C/Z20°C	8	6	4	4	4	4	
Load life	After applying rated working voltage for 2000hours at +85°C and then being stabilized at +20°C, capacitors shall meet following limits.							
	Capacitance change	Within $\pm 20\%$ of initial measured value						
	Tan δ	$\leq 200\%$ of initial specified value						
	Leakage current	\leq Initial specified value						
Shelf life	After storage for 1000hours at +85°C with no voltage applied and then being stabilized at +20°C, capacitors shall meet following limits.							
	Capacitance change	Within $\pm 20\%$ of initial measured value						
	Tan δ	$\leq 150\%$ of initial specified value						
	Leakage current	$\leq 0.002CV + 1\mu A(2\text{ min})$

■ Features

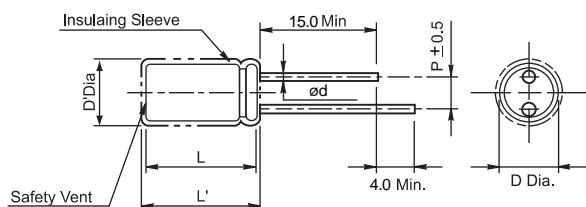

- Very low impedance and ESR at high frequency
- Large permissible ripple current
- High performance and reliability
- For switching mode power supplies (SMPS)
- Load life of 2000 hours at 105°C
- Possible cleaning by Freon TE, TES, TMS (5 min)

■ Specifications

PERFORMANCE CURVES

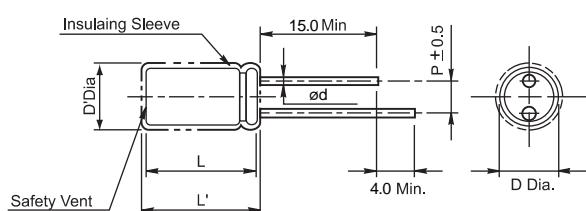

■ Features

- Miniature, Radial (Smaller than RSF)
- Low impedance value at high frequency
- High performance and reliability
- Load life of 2000 hours at 105°C
- Possible cleaning by Freon TE, TES, TMS (5 min)

■ Specifications

Item	Performance Characteristics										
Operating temperature range	-55°C ~ +105°C										
Rated working voltage range	6.3V ~ 63V										
Nominal capacitance range	0.47μF ~ 6800μF, ±20% (at 20°C, 120Hz)										
D.C Leakage current(at 20°C)	The following specifications shall be satisfied when the rated voltage is applied for the required time. I ≤ 0.01CV (2 min) Where I=Leakage current(μA) C=Nominal capacitance(μF) V=Rated voltage(V)										
Tan δ(max., at 20°C, 120Hz)	W.V(V)	6.3	10	16	25	35	50				
	Tan δ	0.22	0.19	0.16	0.14	0.12	0.10				
When capacitance is over 1000μF, Tan δ shall be added 0.02 to the listed value with increase of every each 1000μF.											
Characteristics at low temperature(max.) (impedance ratio at 120Hz)	W.V(V)	6.3~10		16		25~63					
	Z-55°C/Z20°C	3		2		2					
Load life	After applying rated working voltage for 2000 hours at +105°C and then being stabilized at +20°C, capacitors shall meet following limits.(5, 6.3, 8φ: 1000 Hours)										
	Capacitance change		Within ± 20% of initial measured value								
	Tan δ		≤ 200% of initial specified value								
	Leakage current		≤ Initial specified value								
Shelf life	After storage for 1000 hours at +105°C with no voltage applied and then being stabilized at +20°C, capacitors shall meet following limits.										
	Capacitance change		Within ± 20% of initial measured value								
	Tan δ		≤ 150% of initial specified value								
	Leakage current		≤ 200% of initial specified value

I_R = Max. permissible ripple current[mA(rms) at 105°C, 100KHz]

Z = Max. Impedance [Ω at 20°C, 100KHz]

Features

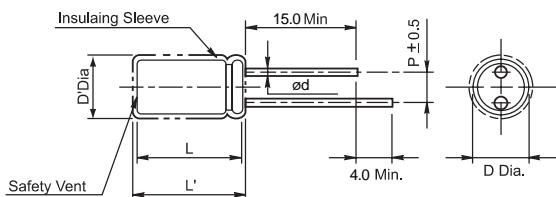

- Wide operating temperature range, Radial (-55°C ~ +105°C)
- Close capacitance tolerance.
- Excellent low temperature characteristics.
- For TV vertical circuit, O.S.C circuit, timing circuit etc.
- load life of 1000 hours at 105°C

**Specifications**

Features

- Extended Operating temperature range (-40°C ~ +125°C)
Radial (Equivalent to 16000 hours life at 85°C)
- very low leakage current
- Low impedance value at high frequency
- Low dissipation factor

**Specifications**

Item	Performance Characteristics												
Operating temperature range	-40°C ~ +125°C

Max. permissible ripple current [A(rms) at 85°C, 120Hz]
Case size [ø DxDxL(mm)]

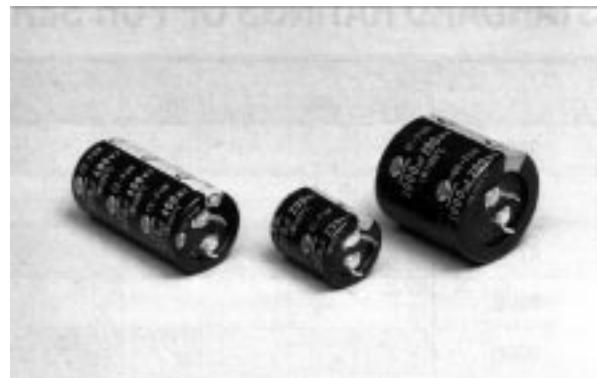

PERFORMANCE CURVES

————— 80V 2200 μ F
 - - - - 200V 680 μ F
 - - - - 400V 390 μ F

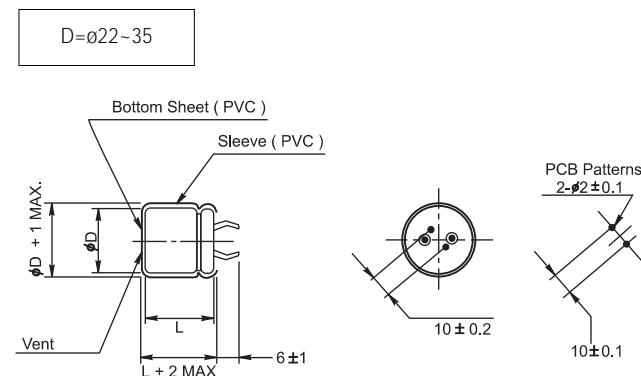

Features

- 105°C Standard, snap-in terminal
- PCB Mounting
- High CV density
- Load life of 2000 hours at 105°C

**Specifications**

Item	Performance Characteristics					
Operating temperature range	10V ~ 250V:-40°C ~ +105°C 315 ~ 450V:-25°C ~ +105°C					
Rated working voltage range	10V ~ 450V					
Nominal capacitance range	47μF ~ 47000μF, ±20%(at 20°C, 120Hz)					
D.C Leakage current(at 20°C)	The following specifications shall be satisfied when the rated voltage is applied for the required time. Where I=Leakage current(μA) C=Nominal capacitance(μF) V=Rated voltage(V) I ≤ 0.02CV or 2mA (5 min), whichever is less.					
Tanδ(max., at 20°C, 120Hz)	W.V(V)	10~25	35~50	63~100	160~250	315~450
	47~2200μF	—	0.20	0.15	0.10	0.20
	2700~6800μF	0.30	0.25	0.20	—	—
	8200μF	0.35	0.30	0.25	—	—
	10000~33000μF	0.60	0.45	0.30	—	—
Characteristics at low temperature(max.) (impedance ratio at 120Hz)	39000~47000μF	0.80	—	—	—	—
	W.V(V)	10~16	25~100	160~250	315~450	
	Z-25°C/Z20°C	4	3	3	8	
Load life	Z-40°C/Z20°C	12	6	6	—	
	After applying rated working voltage for 2000 hours at +105°C and then being stabilized at +20°C, capacitors shall meet following limits.					
	Capacitance change	Within ± 20% of initial measured value				
	Tanδ	≤ 200% of initial specified value				
Shelf life	Leakage current	≤ Initial specified value				
	After storage for 1000 hours at +105°C with no voltage applied and then being stabilized at +20°C, capacitors shall meet following limits.					
	Capacitance change	Within ± 15% of initial measured value				
	Tanδ	≤ 150% of initial specified value				
	Leakage current	≤ Initial specified value				

Case sizes and Dimensions**Ripple current coefficient****Frequency**

Max. permissible ripple current [A(rms) at 105°C, 120Hz]
Case size [øDxL(mm)]

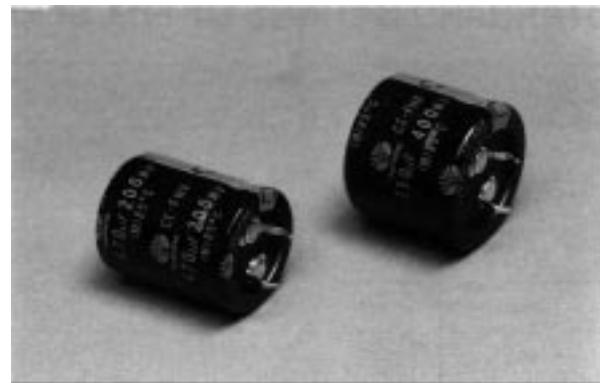

PERFORMANCE CURVES

— FUH 16V 33000 μ F
 - - - FUH 100V 1200 μ F
 - - - FUH 200V 1500 μ F

Features

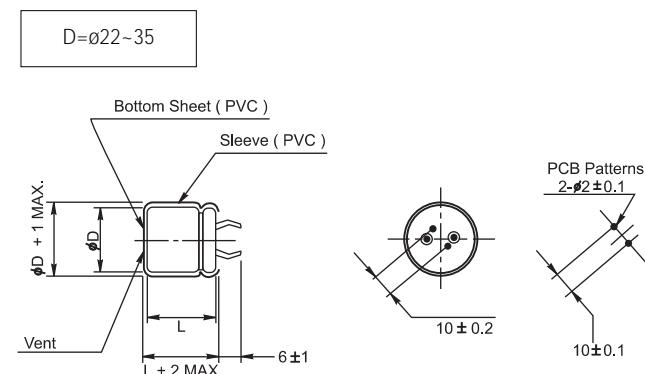

- PCB Mounting, Low profile
- Very compact size(Smaller than FHS series)
- High CV density
- Load life of 2000 hours at 85°C

Specifications

Item	Performance stics		
Operating temperature range	160V ~ 250V : -40°C ~ +85°C	5 ~ 450V : -25°C ~ +85°C	
Rated working voltage range	160V ~ 450V		
Nominal capacitance range	56μF ~ 2700μF, C, 120Hz)		
D.C Leakage current(at 20°C)	The following specifications shall be satisfied when the rated voltage is applied for the required time. $I \leq 0.02CV$ or 2mA (5 min), whichever is less. Where I =Leakage current(μA) C=Nominal capacitance(μF) V=Rated voltage(V)		
Tanδ(max., at 20°C, 120Hz)	W.V(V)	160~250	315~450
	Tanδ	0.15	0.20
Characteristics at low temperature(max.) (impedance ratio at 120Hz)	W.V(V)	160~250	315~450
	Z-25°C/Z20°C	4	8
	Z-40°C/Z20°C	12	—
Load life	After applying rated working voltage for 2000 hours at + 85°C and then being stabilized at +20°C, capacitors shall meet following limits.		
	Capacitance change	Within $\pm 20\%$ of initial measured value	
	Tanδ	$\leq 200\%$ of initial specified value	
	Leakage current	\leq Initial specified value	
Shelf life	After storage for 1000 hours at +85°C with no voltage applied and then being stabilized at +20°C, capacitors shall meet following limits.		
	Capacitance change	Within $\pm 15\%$ of initial measured value	
	Tanδ	$\leq 150\%$ of initial specified value	
	Leakage current	\leq Initial specified value

Max. permissible ripple current [A(rms) at 105°C, 120Hz]
Case size [øDxL(mm)]

Features

- PCB Mounting
- Long life and excellent stability (equivalent to 13 years at 60°C)
- No derating at high temperature
- For industrial and commercial applications.
- High ripple current capability
- Load life of 5000 hours at 105°C

**Specifications**

Item	Performance Characteristics		
Operating temperature range	160V ~ 250V : -40°C ~ +105°C 400V : -25°C ~ +105°C		
Rated working voltage range	160V ~ 250V, 400V		
Nominal capacitance range	39μF ~ 1200μF, ±20%(at 20°C, 120Hz)		
D.C Leakage current(at 20°C)	W.V(V)	160~250	400
	Tanδ	0.10	0.20

Max. permissible ripple current [A(rms) at 105°C, 120Hz]
Case size [øDxL(mm)]

Features

- Screw terminal type
- Smaller dimensions and large capacity
- Ideal for inverter, computer
- Large allowable ripple current
- Load life of 2000 hours at 85°C

**Specifications**

Item	Performance Characteristics				
Operating temperature range	10V ~ 250V : -40°C ~ +85°C 315 ~ 450V : -25°C ~ +85°C				
Rated working voltage range	10V ~ 450V

Max. permissible ripple current [A(rms) at 85°C, 120Hz]

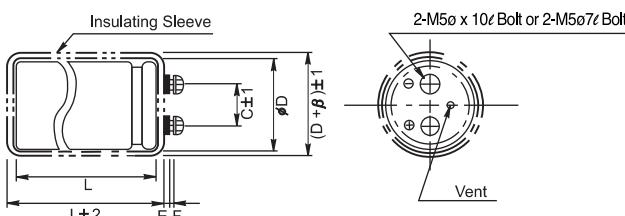

Case size [ØDXL(mm)]

Features

- Screw terminal type
- Ideal for inverter, computer
- Large allowable ripple current
- High reliability for continuous operation
- Computer grade, Large capacity.
- Load life of 2000 hours at 105°C

**Specifications**

Item	Performance Characteristics						
Operating temperature range	-40°C ~ +105°C						
Rated working voltage range	10V ~ 250V						
Nominal capacitance range	220μF ~ 470000μF, -10 ~ +50%(at 20°C, 120Hz)						
D.C Leakage current(at 20°C)	The following specifications shall be satisfied when the rated voltage is applied for the required time. Where I=Leakage current(μA) C=Nominal capacitance(μF) V=Rated voltage(V) $I \leq 0.02CV$ or $5mA$ (5 min), whichever is less.						
Tan δ(max., at 20°C, 120Hz)	W.V(V)	10~16	25	35	50	63~100	160~
	220~10000	—	0.35	0.30	0.25	0.15	0.15

	150000~220000	1.00	1.00	—	—	—	—
	330000~	1.50	—	—	—	—	—
Characteristics at low temperature(max.) (impedance ratio at 120Hz)	W.V(V)	10~16	25~35	50~100	160~250		
	Z-25°C/Z20°C	4	3	2	2		
	Z-40°C/Z20°C	12	6	4	8		
Load life	After applying rated working voltage for 2000 hours at +105°C and then being stabilized at +20°C, capacitors shall meet following limits.						
	Capacitance change	Within $\pm 20\%$ of initial measured value					
	Tan δ	$\leq 200\%$ of initial specified value					
	Leakage current	\leq Initial specified value					
Shelf life	After storage for 1000 hours at +105°C with no voltage applied and then being stabilized at +20°C, capacitors shall meet following limits.						
	Capacitance change	Within $\pm 20\%$ of initial measured value					
	Tan δ	$\leq 150\%$ of initial specified value					
	Leakage current	\leq Initial specified value

Max. permissible ripple current [A(rms) at 105°C, 120Hz]
Case size [ØDxL(mm)]

Features

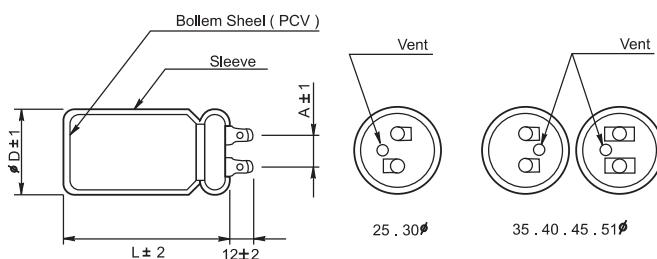

- Lug terminal
- For motor starting
 - compressor starter of a refrigerator, air conditioner and water pump.

Specifications

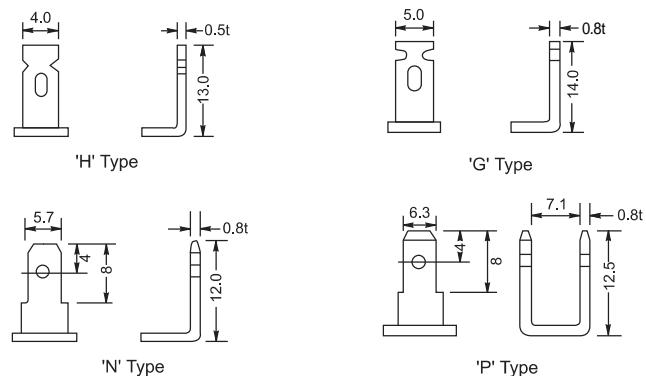

Item	Performance Characteristics
Operating temperature range	-25°C ~ +70°C
Rated working voltage range	110V ~ 300V
Nominal capacitance range	25μF ~ 500μF
Capacitance tolerance	0% ~ +20%(at 20°C, 60Hz)
Power factor	0.08 Max. (at 20°C, 60Hz)
Over voltage test	1. The capacitor should withstand 1.4 times of the rated voltage, applied for 30 sec. 2. The capacitor should withstand 1.2 times of the rated voltage, applied for 2 min.
